

# Getting to Elastic

Adapting a Legacy Vertical Application Environment for Scalability

---

*Eric Shamow - USENIX LISA 2011*

# Who Am I?

---

- ❖ Professional Services Engineer for Puppet Labs
- ❖ 13 years in IT, from line SA to manager of large Operations group
- ❖ [eric@puppetlabs.com](mailto:eric@puppetlabs.com)
- ❖ @eshamow
- ❖ <http://www.opsrealist.com>

# Overview

---

- ❖ What's at Issue?
- ❖ Characterizing the Problem
- ❖ Resolving the Problem
  - ❖ Culture
  - ❖ Metrics
  - ❖ Infrastructure
- ❖ Tying it all together

# What's at Issue?

---

- ❖ What does “elastic” mean?
- ❖ Increasing drive to move to “the Cloud”
- ❖ What does elastic mean in our new environment?

# What's at Issue?

---

- ❖ What does “elastic” mean?
- ❖ Increasing drive to move to ~~“the Cloud”~~ IaaS/PaaS/SaaS
- ❖ What does elastic mean in our new environment?

# Characterizing the Problem

---

# Five Questions

---

- ❖ How are servers deployed?
- ❖ Can our apps handle it?
- ❖ When should we expand?
- ❖ When do we contract?
- ❖ What tooling do we use?

# How Are Servers Deployed?

---

# How Are Servers Deployed?

---

Elasticity Requires Automation

# When Should We Expand? When Should We Contract?

---

# When Should We Expand? When Should We Contract?

---

Elasticity Requires Open Metrics

# When Should We Expand? When Should We Contract?

---

Elasticity Requires Open Metrics  
Open Metrics Require Culture Change

# What Does This Have to Do With DevOps?

---

- ❖ Be a professional
- ❖ Share and collaborate on information and resources
- ❖ Build trust
- ❖ Consider surrendering unilaterally
- ❖ Compromise

# Why is Communication Essential?

---

- ❖ Operations does not understand the application
- ❖ Development does not understand the environment
- ❖ Everyone assumes that their understanding of the problem is complete

# Metrics Through Collaboration

---

- ❖ Provide Operational Logs to developers
- ❖ Request structured data in logs developers provide to Operations
- ❖ Key question: what are the pain points for each group?
- ❖ Monitor everything, but don't focus on what doesn't matter until you've managed the rest

# Can Our Apps Handle It?

---

- ❖ Scale Out, Not Up
- ❖ Latency in “the cloud” is not high or low – it’s variable
- ❖ What is your ROI on additional nodes?
  - ❖ Linear
  - ❖ Logarithmic

# Be Prepared for Change

---

# Be Prepared for Change

---

Bottlenecks will move inside your stack

# Be Prepared for Change

---

Bottlenecks will move inside your stack

Have a process for accepting and handling the changes

# When Should We Expand? When Do We Contract?

---

- ❖ Blind automation can be dangerous
- ❖ Impose sanity limits on builds and teardowns
  - ❖ How many can I provision/destroy?
  - ❖ How fast can I provision/destroy?
- ❖ Alert humans in edge cases
- ❖ Consider a pool of offline servers to speed operation

# Tooling (The Short Version)

---

- ❖ Network
  - ❖ DHCP, PXE, DNS, OS and Patch provisioning all must have APIs or script-based management
- ❖ OS
  - ❖ Cobbler, Spacewalk, Foreman
- ❖ Configuration Management
  - ❖ Puppet! (but seriously, please use something)

# Tying It All Together

---

- ❖ You've already done the hard work
- ❖ Servers can be provisioned based on
  - ❖ Metrics agreed upon by business, dev and ops
  - ❖ API-based tooling around infrastructure and automated deployment
- ❖ What next?
  - ❖ Ticketing and change control/review
  - ❖ Integration testing

# Q & A

---
